

About the only detail of the beacons I recall is the output valve, tube is a 4-65A which probably points to an output power of 50 watts or so.

I have a photo or two of the antenna and maybe the beacon on its bench in the IPSO hut at Mawson I could probably dig out if interested. They're in B&W, developed and printed on the station.

4 element yagi with me on the tower. January 1972
