

THE ANTENNA

When VIH was first built, It required an antenna. The antenna mast was built on the site out many separate pieces of Oregon Pine and was then bolted together, giving it the appearance somewhat of a porcupine

The length of the mast once constructed was 185'5 1/2" and 21" Square. A mast of this length would be unable to support it's own weight, so in order to erect it a gin pole was used.
