"RADION" — the Supreme Insulation for Your radio receiving set

When you build your receiving set you want to use absolutely the best insulating material that you can get. Nothing else is quite so important. The tone and audibility of the entire set depend to a great measure upon the insulation.

Radion has proved to be the supreme wireless insulation. It is made solely for radio work and far excels any other material in the four main Radio essentials namely:

1. Low Angle Phase Difference
2. Low Dielectric Contant
3. High Resistivity
4. Low Absorption of Moisture.

Radion also has a fifth very important characteristic—its workability. Even the amateur with ordinary house tools can saw, drill and otherwise work Radion Panels without the slightest danger of their chipping or cracking.

Radion Panels and Parts (dials, knobs, sockets, insulators, etc.) will greatly improve your radio set. Don't be satisfied with inferior substitutes when you can get genuine Radion.

Look for the trade mark stamped on every piece.
